fax: 785-532-3305

## What is a Pest Detector?

Pest Detectors are used to help identify the incidence of Emerald Ash Borer and other pests in Kansas and the counties. The Pest Detectors are our front line of defense against identifying likely infestations. They will promote early detection and will inevitably be meeting and working with the public, in that role information dissemination will be another important activity.

Persons wanting to be on the list of State Pest Detectors will need to attend the one day Pest Detector workshop and commit to being available and involved with the program after completing the training.

Involvement includes being accessible, willing to do site visits if necessary, talking with the public, report pest related activities, protect confidential information and notifying organizers of current contact information.

## Who should attend the workshop?

Anyone with a background in tree or forest health should consider attending the workshop.

Before coming to class participants should be:

- Able to identify common trees
- Willing to be contacted and work with the public
- Prepared and able to visit sites if necessary
- Frequent users of the internet and e-mail
- Ready to document EAB and TCD related activities
- Able to guard confidential information

Examples of potential Pest Detectors include tree care professionals, Master Volunteers (Woodland Advisors, Master Gardeners, Tree Care Advisors, etc), forestry professionals, natural resource professions that work with trees, environmental educators and others.

## If you want to be included on the list of State Pest Detectors, at any of the workshops you must:

- Mark that option when you register at the workshop
- Provide your information when you Register

**Must pre-register. No registrations accepted at the door day of workshop.**
