

# Champion Trees of Kansas

A large tree has a certain mystique. How old is it? What sights and sound has it witnessed? What historical significance does it have? These are questions one often ponders while gazing upwards through the branches of a huge tree.

Landmark trees played an important role in the settling of Kansas, guiding pioneers to their destinations. Such historic trees as the Custer Elm, the Post Office Oak, and the Osage County Cottonwood were guideposts on the Kansas plains.

Reports of large or unusual trees are common in Kansas literature. H.A. Stephens' book, *Trees, Shrubs and Woody Vines of Kansas*, ends with a list of noteworthy examples. His original list of champion trees is now maintained by the Kansas Forest Service. This publication is a continuation of Stephens' work.

The Kansas Champion Tree Program contains a list of the largest trees of many species in our state so they can be identified, preserved, and enjoyed by all. The champion trees listed in this publication include species that are native to Kansas as well as some that have been introduced here. The Kansas Champion Tree Program is affiliated with the Big Tree Program administered by American Forests.

If there is more than one tree listed for a species, they are considered as co-champions. To be a co-champion, the total points of the trees have to be within five points of each other.

Nominations are judged on a point system established by the American Forests' National Register of Big Trees. One point is awarded for each inch of circumference, one point per foot of height and one-fourth point per foot of crown spread.

**Circumference** is measured in inches, at a point on the trunk 4½ feet above ground. On a slope, mark the trunk at 4½ feet above the ground on the uphill and downhill sides of the slope, measure the circumference midway between the two points. If the tree has a fork at or below 4½ feet, measure the smallest trunk circumference below the fork. If a tree forks at or slightly above 4½ feet, the circumference is measured below the influence of the fork.

**Height** is measured in feet, from the base of the trunk to the highest branch.

**Crown spread** is the distance, in feet, from the end of the branches on one side of the tree, through the trunk, to the ends of the branches on the opposite side. Two measurements are made (at right angles), then averaged and divided by four.

**The three measurements added together give a total point score.** Circumference is the most important factor, followed by height and crown spread.

**Photos** help to identify the species and also educate species identification. If considering a tree nomination, please send photos. That national list requires 6

photos with a submission: 1. Entire tree from base to tip with a point of reference such as a person, fence or building. 2. Four photos – one from each cardinal direction that covers the tree base to 8' or above. 3. Entire tree from base to tip with circumference measuring tape in place and a reference object for scale.

Your help is needed to locate and document outstanding trees. If you know of a potential champion tree, please bring it to our attention. You may use the nomination form on the back page. Your nomination will be officially measured and recorded and the results will be forwarded to you.

## National Champions

The following state champion trees are also national champions and appear in the American Forests 2021 National Register of Big Trees: **Eastern Cottonwood, and Common Juniper**. They are designated as a national champion with an asterisk.
